

A large, stylized red geometric shape, resembling a folded piece of paper or a 3D block, is positioned on the left side of the slide. It has sharp angles and a diagonal line running through it.

Zimension

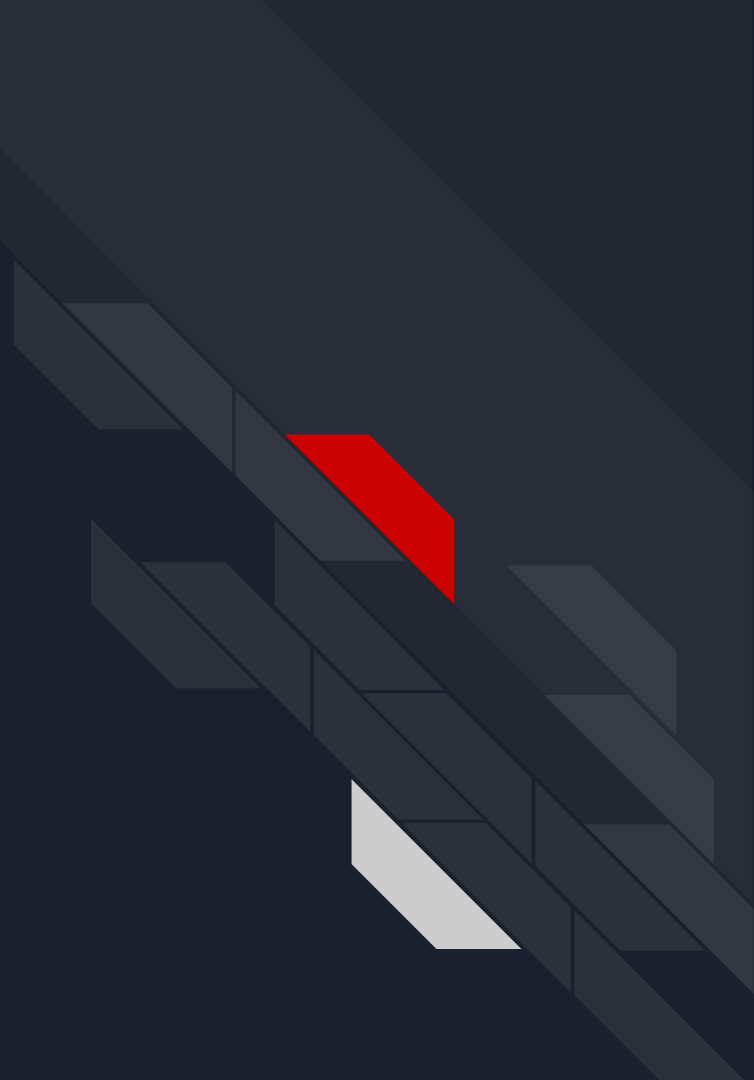

3D Virtual Spaces

Open Metaverse Platform

app.zimension3d.com

Introduction

Zimension Virtual Spaces is a web based 3D engine and content platform where users can create and experience their own virtual world on any device (VR included) with other users.

Current Situation and challenges

- 3D Game or Content creation is very difficult especially for beginners and non coders.
- It is very time consuming to find , optimize , license or create 3D assets for your game
- 3D artists are not able monetized their 3D assets and are just using to for portfolio.
- Very difficult and expensive to create and maintain a backend service to handle user data, Real time multiplayer and storage.
- Publishing and distributing the games and content is time consuming especially for early testing.

What is the future

As the devices are getting more and more powerful gaming and 3D content is getting consumed more and more just like videos on reels and tiktok.

Similarly the new trend will be short games and interactive content that will be available on web and VR. VR market is also getting bigger and bigger as many companies are launching their VR headsets.

So it as become very important to have a platform where we create, consume, distribute and monetize this content easily.

Zimension 3D Virtual Spaces is exactly that place.

What is Zimension?

Zimension is like **Canva** for Unity and Unreal engine.

It is a **Web Based Game Engine** where users can create virtual worlds with **No Code**.

In Zimension we have **automated** all the workflows mostly used in any 3D game with third person or first person type. With ready to use and **Configurable** game **environments**, **3D assets**, **inbuilt physics** engine, camera control, **avatar/character automation** and all the logic can be set by just **Event trigger mechanism** (no code).

Game created in Zimension runs inside Zimension in a **Browser** hence supported in almost all OS like IOS, Android, macOS and Windows and Meta quest Horizon (VR) OS with real-time multiplayer and voice communication.

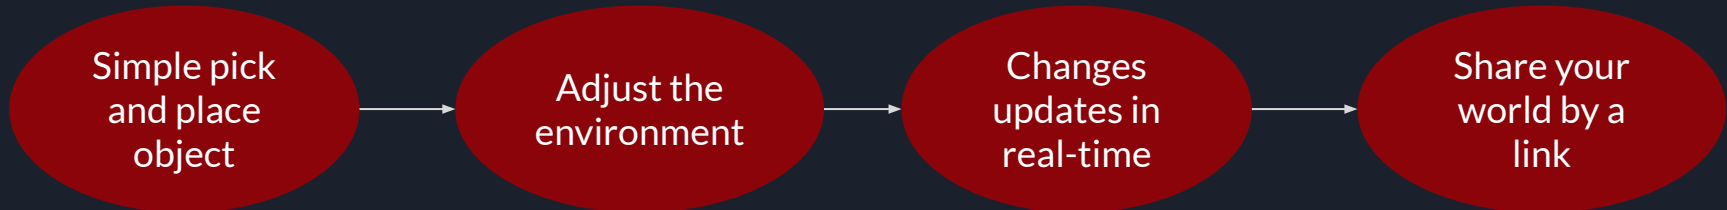

Hence we have full **control** of contents, games and assets monetization along with **Ads** to be shown in the world.

How it works?

Create a free account in Zimension and start making your 3D Game/content or VR experience.

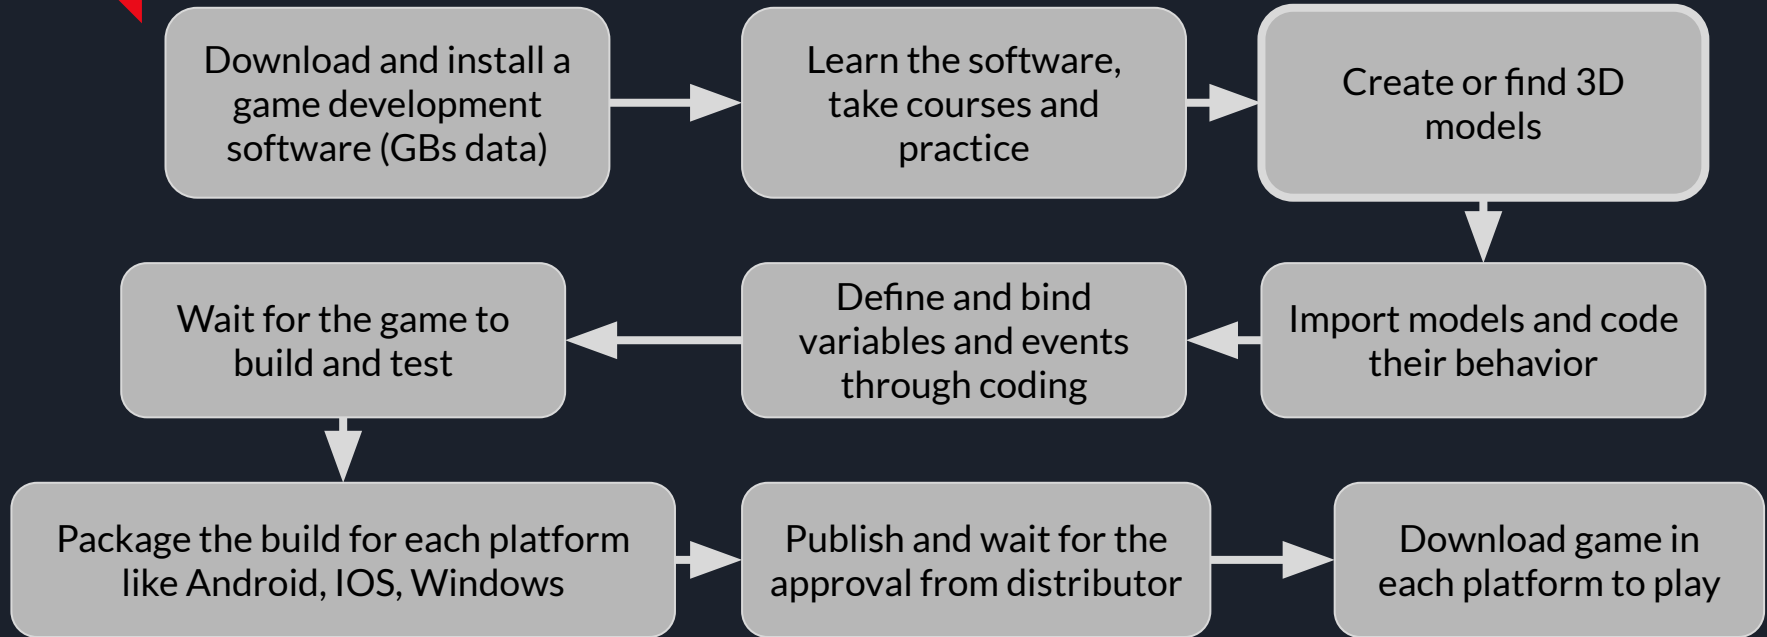

1. Adjust World environment or use our templates
2. Add items to the world from our library with thousands of 3d Assets from 3D artists around the world , or uploading your own 3D models.
3. Select and set up the Avatar or generate new with AI.
4. Share your world with your friends and display your creativity in a highly immersive and engaging manner by just sharing a **link**.

The author of 3D assets use in your world will automatically be shown in the credits section and keeping their interest in adding more items to the library

What are we solving?

Traditional Game/3D experience development cycle (with Unreal and Unity)

This flow needs be repeated even for a slightest change in existing game/experience . And each new game has be created and downloaded separately consuming space on device and download data transfer.

What if the game is online and multiplayer?

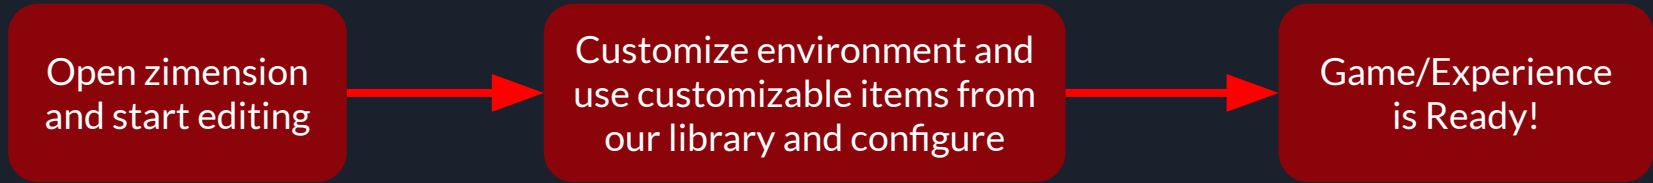

It is a separate headache to create and manage a backend server to maintain data of users and games, On the other hand if the game is multiplayer then it is expensive to both develop and maintain the real-time data transfer required for system.

Real-time voice communication system is in itself a separate time expensive workflow.

Zimension's Backend provided all of these features out of the box for every world you built.

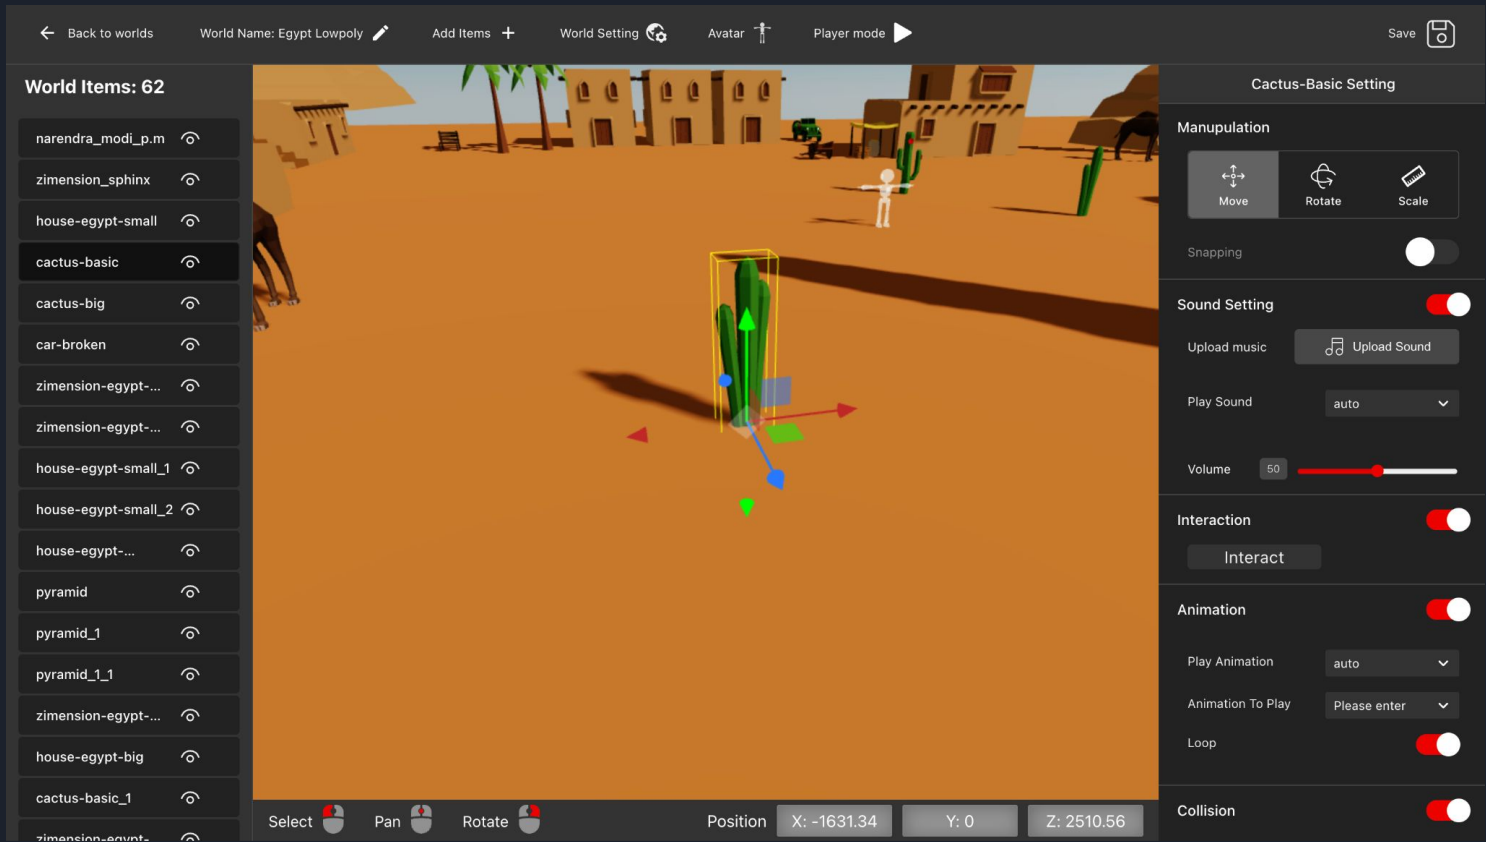

Backend Server ?

How we are solving it

- All changes takes immediate effect.
- No need to download and install a game/app.
- No separate Game/App for each game, all games can be accessible on Zimension.
- Works on all devices via browser and controllers with real time multiplayer, all inbuilt.
- We provide backend and storage along with realtime multiplayer and voice communication

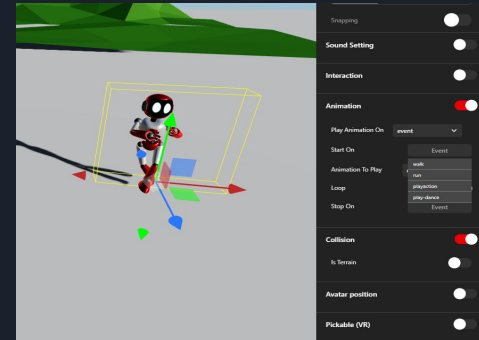

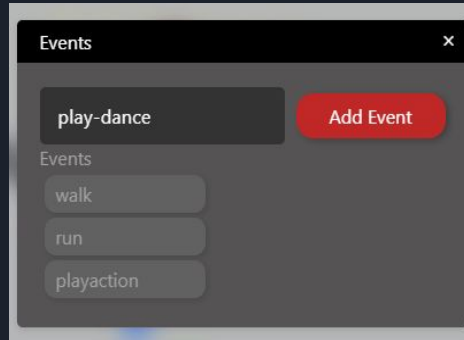

Easy and intuitive editor, no coding needed

Simple Event trigger logic with **No Coding**

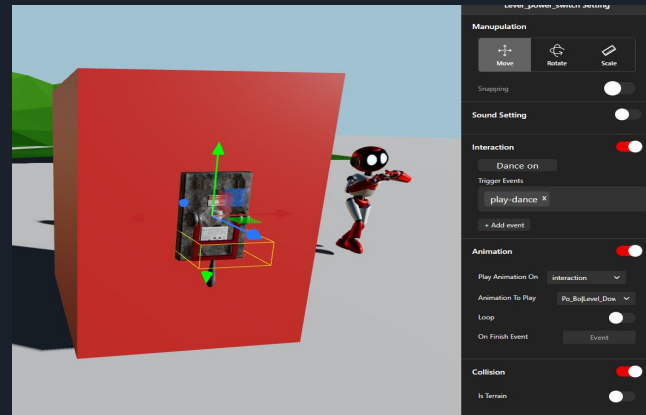

We made a simple event based scripting in the platform.

1. Create events by the name you like
2. Use these events to trigger different behaviour in the world.

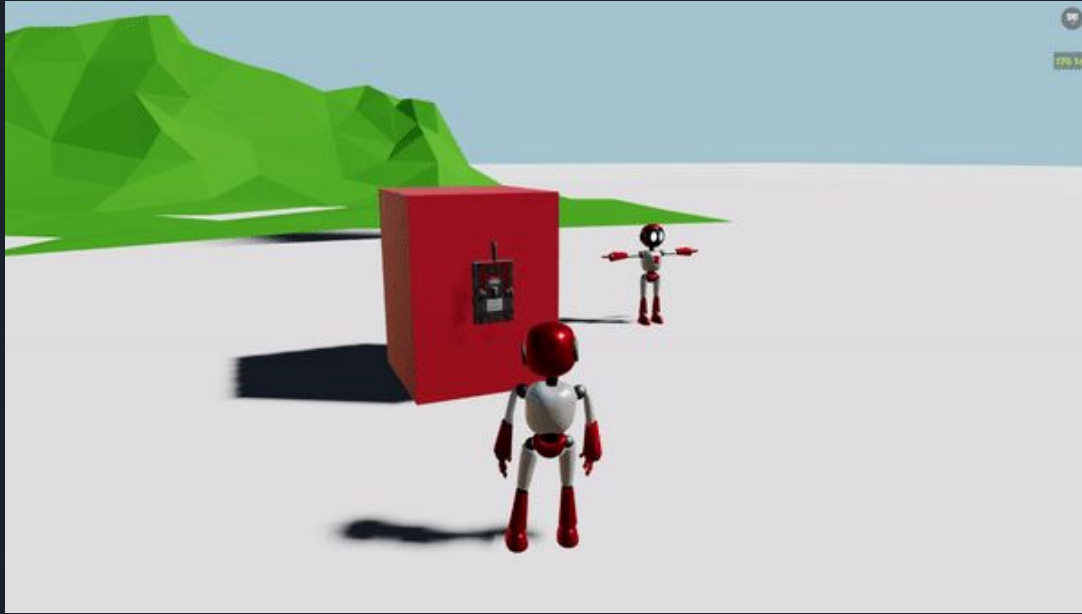

Example let's say I want to make a robot dance on interaction with a switch in the world.

- So I will simply define an **Event** name **play-dance**
- Assign it as **Play animation on** event on **Robot**
- Set this **Event** to trigger **On interaction** property of that **Switch** object.

Done! It's that simple...

You have created
your first
interactive logic

Advantages with Zimension

1. **Intuitive** - No addition software skill required, simply pick and place type of interface.
2. **Device Agnostic** - Since the platform is browser based it can run in any device with a modern browser.
3. **Self Sufficient**: No need of Game development engines like Unreal or Unity, no building time.
4. **Optimized** - We have optimized the platform to work seamlessly in both desktop and mobile devices.
5. **Affordable VR** - Also works with mobile based headset, just get a normal VR headset like google cardboard and use your mobile to experience VR.
6. **Personalize** - Customize your world by adding your own images, videos and sounds to some of our customizable and modular Library items in your world.
7. **Use Templates** - Use pre built template worlds to edit and customize as per your needs saving huge time.
8. **Credit Assurance** - We ensure the owner of 3D asset is given credit in world where it is used.

Characters and avatar

Characters are responsible to make any game alive, however it is a very hectic job in finding the right character, rigging it, animating it and adding dialogues with lypsinc to them.

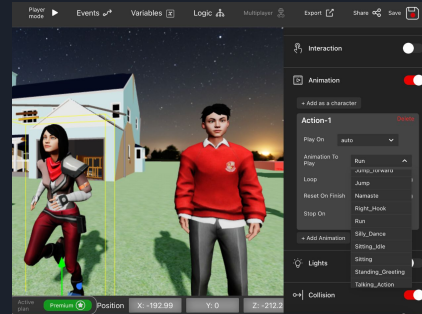

We successfully integrated two character creating/generating services like

1. Ready player me
2. Ultron

These character automatically gets imported with all necessary animation and can be used as Avatars as well

ULTRON generative AI characters

Ready Player Me characters

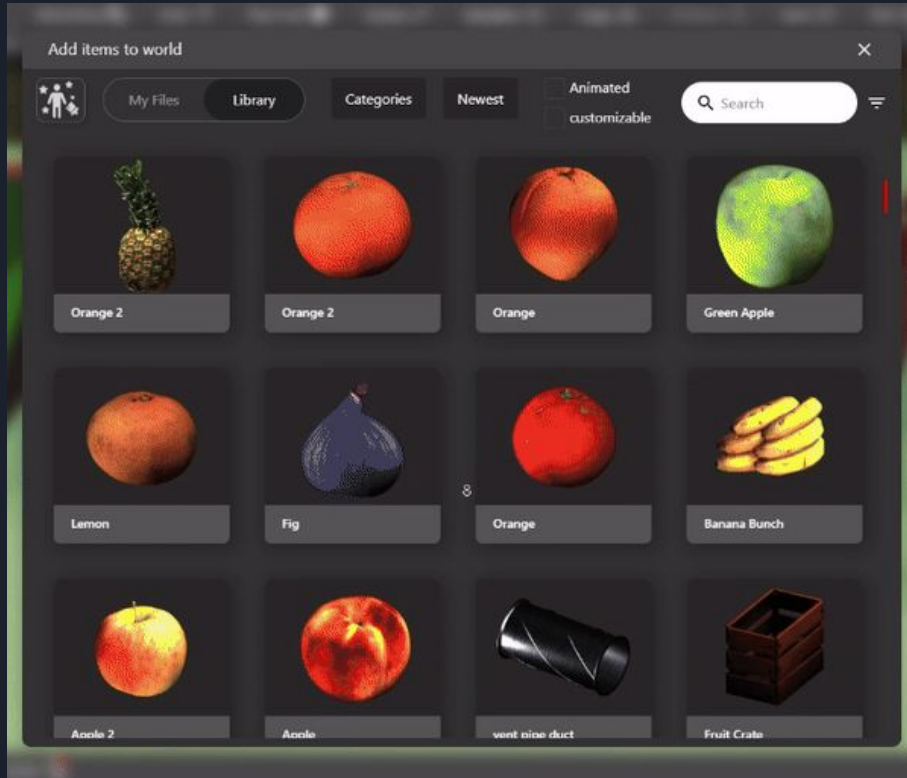

Automatic Facial movements based on dialogue audio

Imagine an automated workflow where user just write the dialogue for a character and the voice with facial expression automatically gets generated. This saves a very huge chunk of time in storytelling workflow in game development. This can also be linked with AI chatbot for real time interactions,

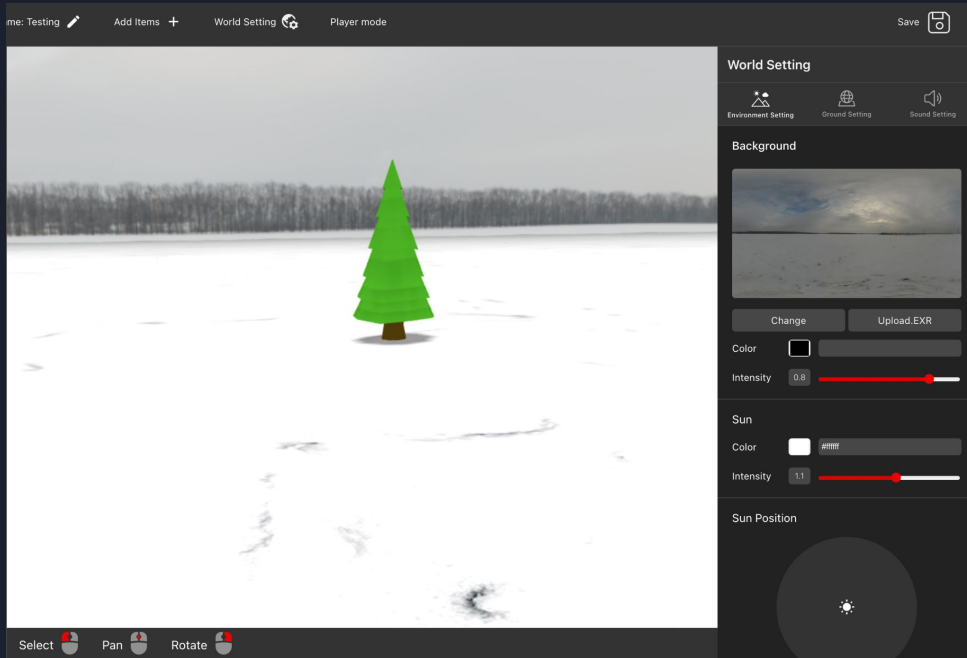

From Text to Screenplay!

Choose from thousands of options from library

- Add from thousands of items from our ever increasing library to your world.
- Users can buy or use premium items as well to benefit creators.
- Users can also add their own 3D models created in 3D modeling softwares or downloaded from some other websites.
- You can find a range of free 3D models on Sketchfab.com, free3d.com, thingiverse.com, grabCAD and many more.
- We support engineering CAD files too like .Step, stp with assembly structures

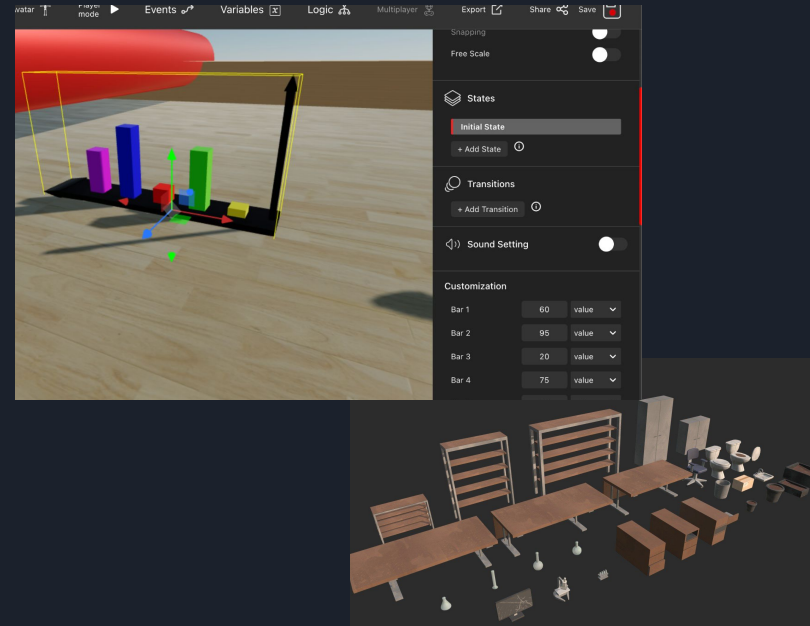

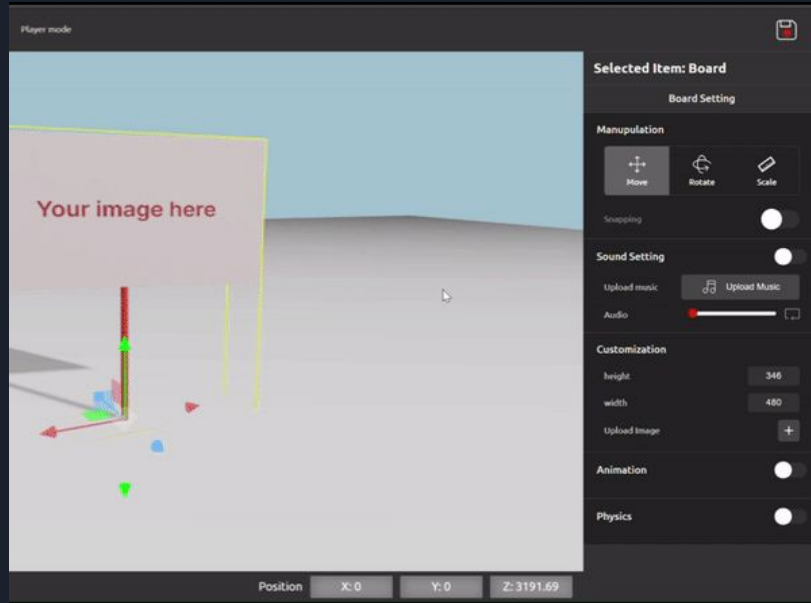

Editing the environment and ground

- Users can set 360 degree background of their world from various samples in the library and adjust its effect on the world.
- The intensity and position of the sunlight can also be edited.
- Users can also choose different ground materials from the library.

Customizable and Modular 3D Assets

Add ready to use customizable 3D assets and adjust by simply changing few parameters.

From low fidelity to very high fidelity

Low Poly simple materials

For low end device like mobile, VR etc

High Poly 4k detailed texture

For High end device gaming PC, Tablets

Invite your friends

- Users can enter into the world they created as a player along with their friends and talk to them like any other virtual meeting and explore the world.
- Your friends Avatars will be visible in real time along with their names.

Inbuilt modes and features

Whatever world you built, you will be able to experience the following modes and features.

View

First person

Third person

Virtual reality

Controls

Mobile touch
controls

Keyboard mouse
controls

Gamepad
controls

Real-time

Real-time
multiplayer

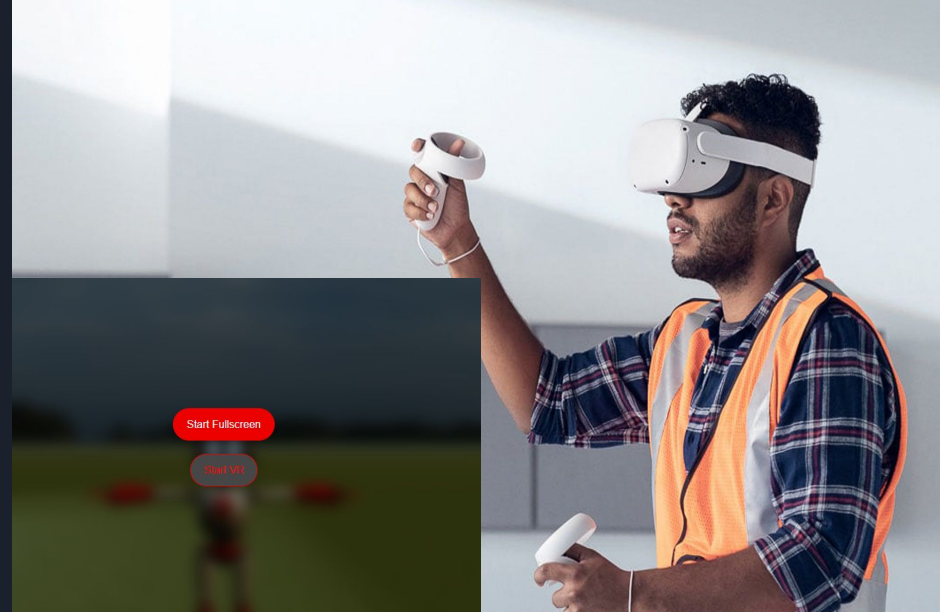

Real-time Voice
communication

One Click VR mode

User can enter into VR mode by Clicking Start VR button at the start screen.

We support both basic Cardboard VR device and advance Meta Quest devices.

Advance VR handset with Hand Controllers will be able to interact or pick pickable objects.

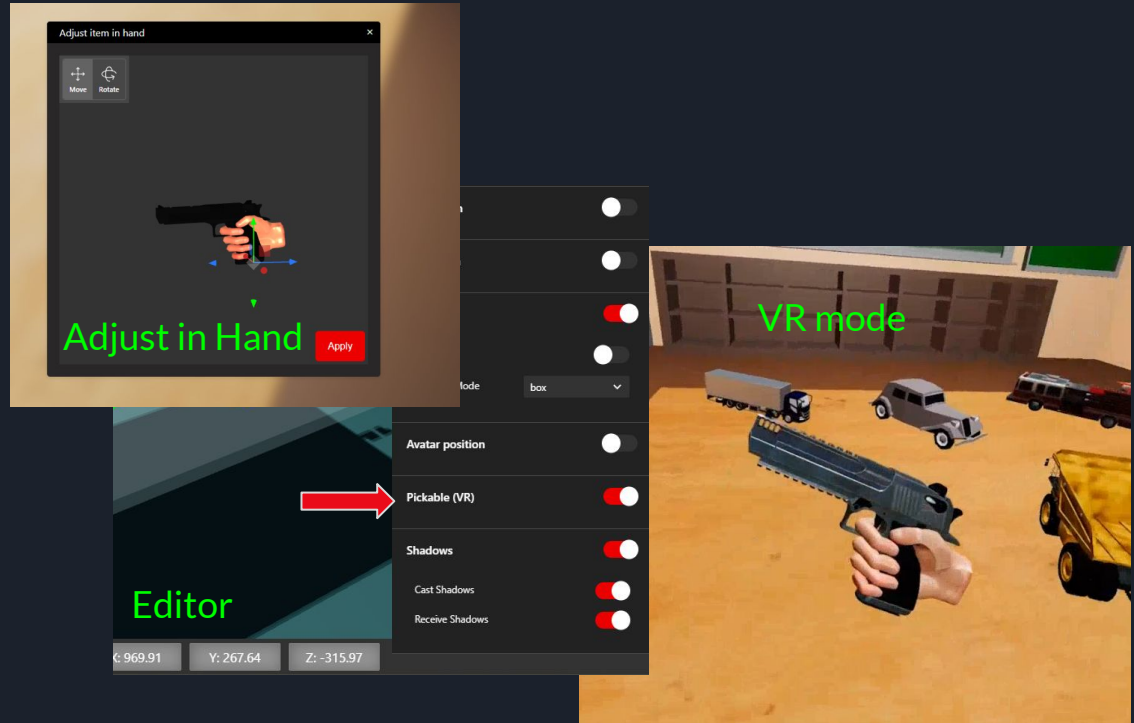

Simple VR Configurations

Just like any other VR game the movement and Jump is through left stick and A button respectively (in meta Quest 2)

You make any object Pickable by simply toggling the Pickable option. That's it!

Also the button interaction get replaced with touching the interactable objects.

Optimized for mobile devices

Upcoming Features

- **Marketplace In Metaverse**
We will be adding a marketplace in the platform with a cryptocurrency for users to buy and sell virtual items.
- **A platform for 3D Content creator**
We will reward content creators for creating more engaging worlds.
- **Integration with industries using digital twins**
We can have virtual replicas of factories with real data from machines with the help of their digital twins.

Benefits for creators

1. Creators can list their 3D models for free or for sell on Zimension asset store. This way they can make some money selling their 3D assets. For free Items they will surely be given Credits in each world where their assets have been used.
2. Creators can also list their 3D assets as premium so that they can earn recurring revenues from the premium users using these assets.
3. If a creator ads a Ad enable 3D asset from our Library they can earn ad revenues based on user engage with that Ad in the world/ Game.
4. Creators can publish their worlds with Buy now or Subscription based access to earn from their games/worlds.
5. Creators can directly collaborate with brands to make direct promotional deals to make games/worlds for them.

Users can only use the 3D assets in Zimension with no option to download. Hence solves the problem of piracy and unauthorized use of their work. Also Zimension make sure the credits are given to the owners of 3D assest.

Revenue model

- **Subscription** plan where better plan means (\$9 to \$49 monthly)
 - More storage
 - Bigger area for world
 - Access to premium library items and assets
 - Access to premium worlds
- 5% Commission from every **Purchase** in **Game Asset marketplace**
- 10% commission in world Access pass **Purchase** for **Paid Worlds/Games**.
- **Ad revenue** from **Ads** shown on Ad enabled 3D Models in the worlds
- Direct revenues from **Promotional Events project** from business clients.

Future is Web

With the latest WebGPU support in browsers all the limitations of a web browser's capability to run high quality 3D contents are smaller and smaller.

WebGPU let's the browser communicate directly with your Device Graphics Processing unit (GPU) not just for rendering beautiful graphics but also computing complex data.
